Title : The Application of Polyvinyl Chloride Plasticizer in a Communication System.

Orig Pub: Tehn. noua, 1958, 5, No 151, 5.

Abstract: A comparison is given concerning the physical-chemical and dielectric properties of polyvinyl chloride plasticizer (I) and rubber (II) which are used in the communication system. It is pointed out that I is superior to II, particularly in respect to the diffusion coefficient value and water resistance (II after being kept in water for 2040 hours loses the insulating

TITLE: Disturbances in the F2 ionosphere layer during the period of sudden and gradual commencement magnetic storms

CITED SOURCE: Tr. In-ta zemn. magn., ionosfery i rasprostr. radiovoln.
AN SSSR, ch. 1, vy*p. 20, 1962, 128-136

TOPIC TAGS: magnetic storm, gradual commencement, sudden commencement, ionosphere, Arctic and Antarctic Institute, corpuscular flow

TRANSLATION: The problem of the change in fo F2 during magnetic storms with sudden (SC) and gradual (G) commencements is examined. Ionosphere data from station Moskva (Moscow) during the period 1949-1953 is used. The selection of the magnetic storms was done according to the catalog of the AANII (Arctic and Antarctic Scientific Research Institute). It was found that moderate SC-storms are accompanied by a significant decrease in fo F2 and that for G-storms such a

Card 1/2

L 19280-63

ACCESSION NR: AR3006921

decrease in frequency is not very likely. Large SC- and G-type storms are accompanied by a decrease in fo F2. The theory is expressed that these and other known differences in type SC and G storms are the result of differences in the physical properties of the corpuscular fluxes causing them.

TITLE: Dependence on the width of the forbidden band in germanium on the concentration of current carriers

SOURCE: Fizika tverdogo tela, v. 5, no. 6, 1963, 1730-1732

TOPIC TAGS: forbidden band, current carrier, emission spectrum, Ge, semiconductor, diffusion coefficient, current density, recombination, carrier concentration

ABSTRACT: Results are given of experimental study on the spectrum of recombination emission in Ge at a high injection level. Nonequilibrium carriers were produced by application of current pulses in a forward direction toward the Ge diode. The recombination emission was plotted against current density, and it was found that increase in current density shifted the long-wave edge of emission toward lower energy. To prove that this shift was not due to heating of the sample during passage of current, spectra were observed for different frequencies and durations of current pulses, and it was established that the shape of the spectrum did not change for pulse durations ranging from 5 to 10 microseconds or for frequencies ranging from 0.5 to 4 kilocycles. Because of a decline in

Card 1/2

L 13009-63

ACCESSION NR: AP3001299

diffusion coefficient the rate of increase in current-carrier concentration during increase in current density may prove to be less than expected. It is noted that if the condition

$$\frac{\sigma}{4\pi\epsilon} \ll \frac{A}{E}$$

(where σ is conductivity and E_g is width of the forbidden band in the semiconductor) is not fulfilled, the forbidden band determined by electrostatic interaction of carriers will manifest constriction only during emission, not during absorption. This condition in Ge is met if the electron concentration exceeds 3×10^{18} per cm³. "The authors express thanks to S. M. Ryvkin for valuable counsel during the performance of their work and to V. I. Bonch-Bruyevich and L. V. Keldysh for useful discussions." Orig. art. has: 2 figures and 1 formula.

Analytical method for calculating the drying process.
Ya. I. Ashin and A. M. Lastovtsev. Khim. Maschinostr. No. 4, 23-7 (1937); Chem. Zentral. 1938, I, 1173.
The following equations are developed for calcg. the moisture content of the drying air upon entrance (d_1) and exit (d_2) from the dryer, using values for the temp. of the air as it enters (t_1) and as it leaves (t_2), the heat content of the water vapor at the latter temp. (t''_2) and the heat loss Δ in Cal. per hr.: $d_1 = [(240 + 0.47 d_2)(t_1 - t_2)/(t''_2 - \Delta)] + d_2$; and $d_2 = [d_1(t''_2 - \Delta) - 240(t_1 - t_2)]/[0.47(t_1 - t_2) + (t''_2 - \Delta)]$. The analytical method based on these equations has the advantage of greater accuracy and simplicity over the graphical method. W. A. Moore

TITLE: The Calculation and Design of an Ejector Pump to be Used to Mix a Liquid in an Apparatus (Konstruktsiya i raschet ezhektora, prednaznachennogo dlya peremeshivaniya zhidkosti v apparaite)

PERIODICAL: Tr. Khar'kovsk. politekhn. in-ta, 1957, Vol 13, pp 129-133

ABSTRACT: For better mixing of a liquid in an apparatus the author proposes to make use of the kinetic energy of the jet emitted from an ejector pump. Therefore, an ejector pump used to mix a liquid in an apparatus is not equipped with an outlet diffuser and consists only of a high-pressure nozzle and a mixing chamber. The author gives an account of a hydraulic method for calculating an ejector pump operating in a cylindrical mixing chamber and not equipped with an outlet diffuser. Fundamental equations are evolved for calculations based on the assumption of an incompressible liquid flow. With the aid of these equations it is possible to select the most suitable basic shape and dimensions for an ejector pump intended for the use

TITLE:

Removal of Salt From Industrial Condensates of Nitrogen
Fertilizer Enterprises by Means of Ion Exchange Resins

PERIODICAL:

Khimicheskaya promyshlennost', 1959, Nr 6, pp 499 - 501
(USSR)

ABSTRACT:

The vapor condensate of the evaporators used in the nitrogen fertilizer industry is contaminated with NH_4^+ and NO_3^- ions and has to be purified prior to its further use (as a steam boiler feed). Experiments carried out under the supervision of B. D. Bryanskiy (deceased) showed that by means of ion exchange resins it is not only possible to remove salt from the condensate but to re-use the ammonium nitrate obtained if the cation exchanger is regenerated with nitric acid and the anion exchanger with an ammonia solution. Among the investigated cation exchangers the type KU-2 proved to be best; in this case the regeneration takes place by means of a

Teoriya podobiya i yeye primeneiye v teplotekhnike; trudy pervoi mezhvuzovskoy konferentsii, 78-81

TEXT: The existing criteria of thermal similitude (Nu , Re , Pr , Pe) are found by the author to be unsatisfactory for the treatment of data on heat transfer, and new criteria are derived. As starting points are used, instead of the Navier-Stokes equations of motion and the equation of continuity, the laws of thermodynamics and the equation of heat transfer. The following three non-dimensional criteria are obtained: φ = criterion of convective heat transfer, F/w = criterion of geometric similitude, S = criterion of thermodynamic similitude. The following relationships between the criteria, valid for gases, liquids, and liquid metals, are determined experimentally:

$$\varphi = S^{12.5}(F/w)^{-0.9} \quad (5)$$

for processes of cooling of the heat carriers, and

N-Arylazolesocyanines. A. I. Kipriabov, P. I. Asina, and I. K. Usenko. *J. Gen. Chem. (U.S.S.R.)* 18, 165-10 (1948) (in Russian).—Using the method of Todd, Bergel, and Karimullah (*C.A.* 30, 347), $\text{C}_6\text{H}_5\text{Ac}$ with MeC_6N derivative of PhNH_2 , 1-C H_5NHNH_2 , α -anisidine, perchlorite which were used as starting materials for the following preps. (no data given on the above). The $\text{Phenyl-3,4-dimethylthiazolium perchlorate}$ (1 g.), 1 g. HCl(OEt) , and 5 ml. pyridine were refluxed 1.6 hrs.; on cooling, the unreacted thiazolium compd. separated, the filtrate on addn. of H_2O and EtO gave 1.1 g. (14%) bis(3-phenyl-4-methyl-2-thiazole)trimethinecyanine perchlorate, decomp. 232° (from 30% EtOH), brown, with absorption max. 566 m μ in EtOH . Similarly, 0.7 g. bis(3-(naphthyl)-4-methyl-2-thiazole)trimethinecyanine perchlorate, decomp. 258° (from 40% EtOH), absorption max. 569 m μ . Analogously, 1-(ρ -methoxyphenyl)-2,4-dimethylthiazolium perchlorate, bis[3-(ρ -methoxyphenyl)-4-methyl-2-thiazole]trimethinecyanine perchlorate (low yield), dark needles, decomp. 238° (from 40% EtOH), absorption max. 565 m μ , while 1-(ρ -dimethylaminophenyl)-2,4-dimethylthiazolium perchlorate gave deep blue needles of bis(3-(ρ -dimethylaminophenyl)-4-methyl-2-thiazole)trimethinecyanine perchlorate, 217° (contains some water of cryst.), absorption max. 568 m μ . Refluxing 0.5 g. 3-phenyl-2,4-dimethylthiazolium perchlorate, 0.23 g. α -anilinoacrolein anil-HCl, 1 ml. pyridine, 0.8 g. NaOAc , and 3 drops H_2O for 10 min., followed by addn. of eq. alc., gave 17% bis(3-phenyl-4-methyl-2-thiazole)trimethinecyanine perchlorate (from

10

APPROVED FOR RELEASE: 06/05/2000

CIA-RDP86-00513R000102410011-1"

0% Et(OH), absorption max. 657 m μ . Boiling 0.6 g. 3-phenyl-2,4-dimethylthiazolium perchlorate, 0.77 g. 3-[2-(N-phenylacetamido)vinyl]-2-benzothiazole-EtI, and 5 ml. pyridine 0.5 hr., followed by cooling, gave 18% (3-phenyl-2-thiazol)(3-ethyl-2-benzothiazole)trimethinecyanine perchlorate, decomp. 230° (from Et(OH)), absorption max. 558 m μ . Similar reaction with 3-(1-naphthyl)-4-dimethylthiazolium perchlorate gave [3-(1-naphthyl)-4-methyl-2-thiazol](3-ethyl-2-benzothiazole)trimethinecyanine perchlorate, green powder (from 10% EtOH), 15%, absorption max. 662 m μ . Boiling 5.25 g. 3-methyl-3-phenylbenzothiazolium iodide, 4 g. diphenylnamidine, and 10 ml. Ac₂O 10 min., followed by addn. 1.25 ml. Et₂O gave deep red 3-[2-(N-phenylacetamido)vinyl]-3-phenylbenzothiazolium iodide, m. 210° (30%); this 1 g.) and 0.64 g. 2,4-dimethylthiazole-EtI boiled 40 min. in 1 ml. pyridine, followed by addn. of 25 ml. Et₂O and washing of the ppt. with hot alc., gave 17% deep red (3-phenyl-2-benzothiazole)(3-ethyl-4-methyl-2-thiazol)trimethinecyanine iodide, m. 246° (from alc.), absorption max. 538 m μ ; the mother liquor yielded a 2nd pigment of unknown nature, decomp. 234°, absorption max. 44 m μ , and coning. 4.94-5.19% N. If the form of the unym. pigment having the onium structure on the alkylthiazole nucleus is named A, while the corresponding form with the onium N in the benzothiazole part of the mol. is named B, the following relations are established: (1) with R₁ (group on the N on alkylthiazole) = Et, and R₂ (unim. group on the N on the benzothiazole part) = Et, the hypochromic shift is 16 m μ , and structure A predominates over B; (2) R₁ = Ph, R₂ = Et, gives a 4-m μ shift and A is almost equiv. to B; (3) R₁ = naphthyl, R₂ = Et, give 0 shift and A is equiv. to B; (4) R₁ = Et, R₂ = Ph, gives a 21-m μ shift and A predominates over B. Todd's Bergel's, and Karimullah's methods were used in condensation of chloracetone with thioacetone produced aniline, alpha-naphthyiamine, p-anisidine, and p-aminodimethyl-aniline. As a result authors obtained perchlorates of 3-phenyl-,3-alpha-naphthyl, and 3-p-dimethylaminophenyl-2,4-dimethylazole. By synthesis these produced symmetrical and asymmetrical cyanide dyes. Established strong effect of radical in heteroatomic nitrogen on absorption of asymmetrical carbocyanide, which contains thiazole and benzthiazole nucleus. Submitted 23 Sep 1946.

TITLE: Investigation of the negative resistance of Al_2O_3 -metal contacts

SOURCE: Radiotekhnika i elektronika, v. 11, no. 2, 1966, 298-301

TOPIC TAGS: semiconductor, semiconductor device, semiconductor research

ABSTRACT: The N-type negative-resistance region of Al_2O_3 -Me contacts was investigated by measuring current-voltage characteristics of film-type contacts in which the thickness of the dielectric varied from 100 to 500 Å. The Al_2O_3 layer was formed by oxidizing Al films obtained on glass by vaporization in vacuum. The upper electrode was formed by vacuum-spraying Cu, Sn, In, Au, Ni, Al. Measurements were conducted in air and in vacuum. With In, Al, Sn electrodes, the negative resistance was observed with both polarities of the applied voltage; with the Al electrode, the negative resistance could be detected only in vacuum. With Cu, Ni,

Cord 1/2

L 27521-66

ACC NR: AP6007508

Au electrodes, the negative resistance was observed only in the forward branch of the current-voltage characteristic. In all cases, the maximum current decreased and the negative resistance increased with the increasing layer thickness. Qualitatively, the I-V function could be explained by the Schottky emission law. Electron capture by multicharge centers is assumed to be responsible for the mechanism of the negative resistance. Orig. art. has: 5 figures.

ASNIS, A./E.

Concerning the Quality of Welds Obtained by Automatic Welding Under Winter Conditions. (In Russian). D. I. Medov and A. E. ASNIS. Avtogennoe Selo (Welding), v. 21, Aug. 1950, p. 1-8. The above was investigated for low-carbon steel of ordinary thicknesses. It was found that impact strength and brittleness, under the above conditions are essentially the same as under standard conditions. Probability of formation of pores and cracks increases due to increase of rate of cooling. Conditions under which welding at freezing temperatures is permissible were determined. Experimental data are tabulated and charted.

A. Ye. Asnis, Candidates in Tech Sci, Inst of Elec Welding Imeni Acad Ye. O. Paton,
Acad Sci Ukrainian SSR

"Avtogen Delo" No 8, pp 1-8

Describes experiments to determine effect of low temperatures on quality of low-carbon steel joints welded by automatic method. Concludes: automatic welding under flux of majority of structures made of low-carbon steel 20-25 mm thick can be done satisfactorily at temperatures below freezing. Minimum safe temperature must be established on basis of design and experimental data.

Vibrational Strength of Welded Joints from Low Alloy and
Low Carbon Steels at Room Temperature and 1000° F.

By R. C. Anderson and G. D. Price

Published by the American Society for Testing and

Materials Testing and Research Association

1950, 12 pages, \$1.00

Strength of welded joints from low alloy steels is

not as good as that from high carbon steels.

The strength of welded joints from both kinds of steel is practically

the same. Some data on testing joints from a low alloy steel of

a new kind superior to those used at present are given.

ASNIS A. E.

This effect of gas-oxygen cutting on the surface of the cut
A. E. Arnb and A. S. Den'yachenko, *Avtom. Stroks* 7,
No. 3 (Works No. 38), 65-79 (1954).—In an investigation of
the effect of oxy-gas cutting of low-C and alloy steels it was
found that the high-cutting temps. cause a pick-up of C,
Ni, and Cu in the cutting area. Simultaneously the concen.
of Mn, Si, and Cr show a significant decrease. For a 0.17%
C steel the C content increases to 0.70-0.80% in the vicinity
of the cut edge. In a low-alloy steel the Ni increased from
0.5 to 30.5%. Preheating tends to prevent the pick-up of
Ni and Cu. J. R. Behrman.

AUTHOR: Asnis, A. Ye.

TITLE: Causes of the Reduced Vibrational Strength of Welded Joints in Low-alloyed Steels (Prichiny ponizhennoy vibratsionnoy prochnosti svar-nykh soyedineniy iz nizkolegirovannykh stalei)

PERIODICAL: V sb.: Probl. dugovoy i kontakt. elektrosvarki. Kiyev-Moscow, Mashgiz, 1956, pp 310-318

ABSTRACT: Five different types of low-alloy steel (LAS) were investigated, also killed steel MSt.3 and a new type of Mn steel. All steels possessed a fine-grained structure evaluated at 5-7 units. The methods employed in the course of the investigation consisted of the following procedures: Deposition of bead welds on the surface of 12-mm thick specimens, the quantity of energy supplied per unit length of arc, q/v_c , being 5300 and 7200 cal/cm; macro and micro-studies; vibration testing of metal from the weld zone (WZ). Compared with the parent metal, the hardness of metal in the WZ of LAS, MSt.3 steel, and Mn steel increases by 20, 9, and 12% respectively. The lowest pearlite-ferrite microhardness ratio

Card 1/2

SOV/137-57-6-10225
Causes of the Reduced Vibrational Strength of Welded Joints in Low-alloyed Steels

observed in the WZ of Mn steel and LAS amounts to 1.26 and 1.86, respectively. The σ_w of both the MSt.3 steel and Mn steel attains a value equivalent to 38% of the σ_s , whereas the σ_w of LAS does not exceed 24%. X-ray microstudies and a spectral analysis of the fracture surface demonstrated that the weld boundaries in the LAS suffer a reduction in their Cr and, partially, their Ni and Si contents; their Mn content, however, remains analogous to that of the parent metal. Practically no changes have been observed in chemical composition of the weld boundaries in Mn and MSt.3 steels. Experiments demonstrated that the vibrational strength of welded beams and semiframes of railroad trucks made of Mn steel is 20% higher than the strength of comparable welded assemblies made of LAS or MSt.3 steel.

V.K. Serdyuk, Engineer.

PURPOSE: This booklet is intended for workers in the gas-welding
industry

COVERAGE: The author describes equipment and materials for gas
welding and oxy-gas cutting of metals. He also discusses
organization of the working place, effect of the welding flame
on the metal, and the techniques of welding and oxygen cutting.
He gives data on substitutes for acetylene gas and on the equipment.

PHASE I BOOK EXPLOITATION SOV/1299

Nauchno-tekhnicheskoye obshchestvo mashinostroitel'noy promyshlennosti.
Leningradskoye oblastnoye pravleniye

Prochnost' svarnykh konstruktsiy (Strength of Welded Structures)
Moscow, Mashgiz, 1958. 147 p. (Series: Its: Sbornik, kn. 48)
4,000 copies printed.

Ed.: Okerblom, N.O., Doctor of Technical Sciences, Professor;
Tech. Ed.: Sokolova, L.V.; Managing Ed. for Literature on Machine
Building Technology (Leningrad Division, Mashgiz): Naumov, Ye.P.,
Engineer.

PURPOSE: This collection of articles is intended for engineers,
plant technicians and scientific workers employed in planning and
design bureaus and research institutes. It may also be of use to
students taking advanced courses in welding.

COVERAGE: The book contains the principal reports of a conference
held in Leningrad and sponsored by the Leningrad branch of the
All-Union Scientific, Engineering and Technical Society (VNITO -
Vsesoyuznoye nauchnoye inzhenerno-tekhnicheskoye obshchestvo) of
Card 1/3 .

welders. These reports deal with present-day problems connected with the strength, and endurance of welded structures and the effect of weld stresses. Each article is briefly commented on in the introduction. No personalities other than the authors of the articles are mentioned. There are 45 Soviet and 5 English references.

Translation from: Referativnyy zhurnal. Metallurgiya, 1959. Nr 3, p 124 (USSR)

AUTHOR: Asnis, A. Ye.

TITLE: On the Vibrational Strength of Welded Connections of Low-alloy Steels
(O vibratsionnoy prochnosti svarynykh soyedineniy nizkolegirovannykh
stalej)

PERIODICAL: V sb.: Prochnost' svarn. konstruktsiy. Moscow-Leningrad,
Mashgiz, 1958, pp 55-67

ABSTRACT: A presentation of the results of experimental investigations in which the vibrational strength (VS) of welded connections (WC) of various domestic low-alloy steels (LAS) was determined and compared with analogous connections of mild steel. The vibration tests were performed on round specimens, flat specimens with a transverse weld, welded Nr-20 I-beams made of 12 mm thick steel in 4 m lengths, and full-scale joints in the trucks of all-metal railroad cars. It was established that the VS of WC's in LAS's with unfinished weld surfaces is identical to that of WC's in mild steel. An exception are the WC's in Mn steel which exhibit a greater (by 20%) VS. Fatigue cracks originate and expand primarily in the ferritic constituent. In the

weld zone, in the vicinity of the fusion boundary, the microhardness ratio of pearlite to ferrite amounts to 1.26 in the case of Mn steel and 1.58 in the case of other LAS's tested. The VS increases as the difference in hardness of the constituents diminishes. Near the fusion boundary the metal exhibits a decreased concentration of Cr and, partially, Ni and Si, i.e., the elements which tend to harden the ferrite. The concentration of Mn is the same as in the regions of parent metal which do not undergo any changes. This is one of the factors responsible for the relatively high VS of WC's of Mn steel. In the author's opinion the investigation performed permits establishing the causes of the reduced VS of WC's of LAS produced at the present time and makes it possible to develop measures for the elimination of this drawback.
